PAL decoder TDA3561A

GENERAL DESCRIPTION

The TDA3561A is a decoder for the PAL colour television standard. It combines all functions required for the identification and demodulation of PAL signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 5 V peak-to-peak (picture information) enabling direct drive of the discrete output stages. The circuit also contains separate inputs for data insertion, analogue as well as digital, which can be used for text display systems (e.g. (Teletext/broadcast antiope), channel number display, etc. Additional to the TDA3560, the circuit includes the following features:

- The peak white limiter is only active during the time that the 9,3 V level at the output is exceeded. The start of the limiting function is delayed by one line period. This avoids peak white limiting by test patterns which have abrupt transitions from colour to white signals.
- The brightness control is obtained by inserting a variable pulse in the luminance channel. Therefore the ratio of brightness variation and signal amplitude at the three outputs will be identical and independent of the difference in gain of the three channels. Thus discolouring due to adjustment of contrast and brightness is avoided.
- Improved suppression of the internal RGB signals when the device is switched to external signals, and vice versa.
- Non-synchronized external RGB signals do not disturb the black level of the internal signals.
- Improved suppression of the residual 4,4 MHz signal in the RGB output stages.
- Cascoded stages in the demodulators and burst phase detector minimize the radiation of the colour demodulator inputs.
- High current capability of the RGB outputs and the chrominance output.

QUICK REFERENCE DATA

Supply voltage	$V_{1–27}$	type.	12	V
Supply current	I_1	typ.	85	mA
Luminance input signal (peak-to-peak value)	$V_{10\text{-}27(p\text{-}p)}$	typ.	0,45	V
Chrominance input signal (peak-to-peak value)	$V_{3\text{-}27(p\text{-}p)}$		55 to 1100	mV
Data input signals (peak-to-peak value)	$V_{13,\ 15,\ 17\text{-}27(p\text{-}p)}$	typ.	1	V
RGB output signals at nominal contrast and saturation (peak-to-peak value)	$V_{12,\ 14,\ 16\text{-}27(p\text{-}p)}$	typ.	5,25	V
Contrast control range		typ.	20	dB
Saturation control range		min.	50	dB
Input voltage for data insertion	$V_{9\text{-}27}$	min.	0,9	V
Blanking input voltage	$V_{8\text{-}27}$	typ.	1,5	V
Burst gating and black-level gating input voltage	$V_{8–27}$	typ.	7	V

PACKAGE OUTLINE

PAL decoder TDA3561A

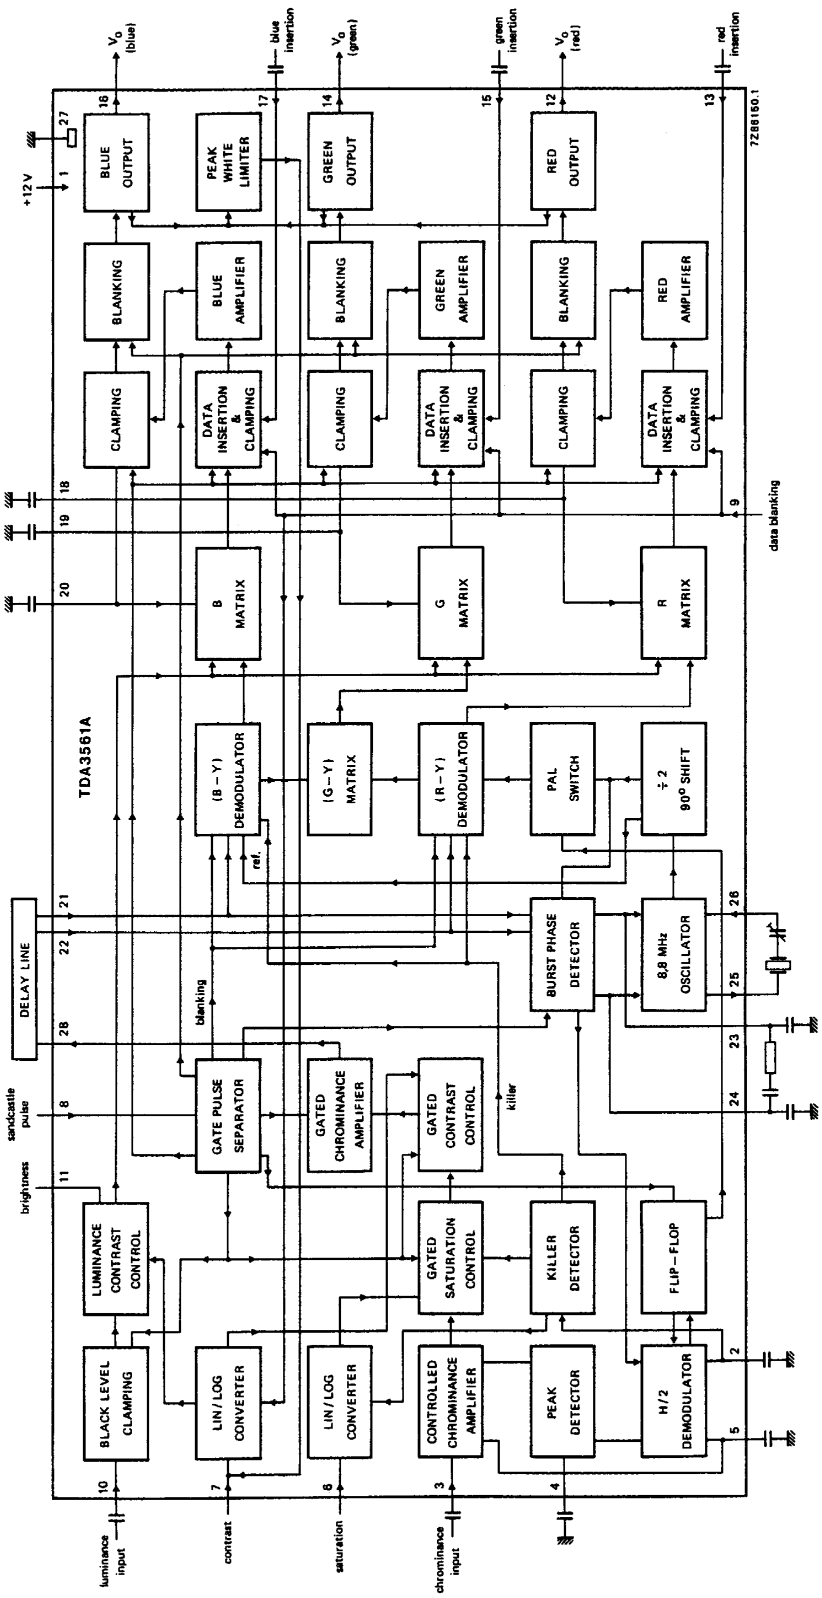

Fig.1 Block diagram.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_P = V_{1\text{-}27}$	max.	13,2	V
Total power dissipation; see also Fig.2	P_{tot}	max.	1,7	W
Storage temperature range	T_{stg}		–25 to + 150	°C
Operating ambient temperature range	T_{amb}		–25 to + 65	°C

THERMAL RESISTANCE

From junction to ambient	$R_{th\ j\text{-}a}$	=	50	K/W

CHARACTERISTICS

$V_P = V_{1\text{-}27} = 12$ V; $T_{amb} = 25$ °C; unless otherwise specified

Supply voltage	$V_P = V_{1–27}$	typ.	12	V
			8 to 13,2	V
Supply current		typ.	85	mA
		<	115	mA
Total power dissipation	P_{tot}	typ.	1,0	W
		<	1,4	W
Luminance input (pin 10**)**				
Input voltage (peak-to-peak value); note 1	$V_{10\text{-}27(p\text{-}p)}$	typ.	0,45	V
Input level before clipping	$V_{10–27}$	<	2	V
Input current; input level 2 V, clamp not active	I_{10}	typ.	0,15	µA
		<	1	µA
Contrast control range (see Fig.3)			–17 to + 3	dB
Control voltage for 40 dB attenuation	$V_{7\text{-}27}$	typ.	1,2	V
Input current contrast control at $V_{7–27} = 3$ V	I_7	<	10	µA
Chrominance amplifier				
Input voltage (peak-to-peak value); note 2	$V_{3\text{-}27}$ (p-p)	typ.	550	mV
			55 to 1100	mV
Input impedance	$\|Z_{3–27}\|$	typ.	9	kΩ
			6 to 12	kΩ
Input capacitance	$C_{3–27}$	typ.	4	pF
		<	6	pF
A.C.C. control range		>	30	dB
Change of the burst signal at the output over the whole control range		<	1,5	dB
Gain at nominal contrast/saturation pin 3 to pin 28; note 3		>	32	dB
Output signal (peak-to-peak value) at nominal contrast/saturation; burst signal: 0,5 V peak to peak	$V_{28\text{-}27(p\text{-}p)}$	typ.	1,7	V

Maximum output voltage (peak-to-peak value)				
R_L = 2 kΩ	$V_{28\text{-}27(p\text{-}p)}$	typ.	4,0	V
Distortion of chrominance amplifier				
at $V_{28\text{-}27(p\text{-}p)}$ = 2 V up to $V_{3\text{-}27(p\text{-}p)}$ = 1 V	d	typ.	1,5	%
		<	5	%
Frequency response between 0 and 5 MHz			–2	dB
Saturation control range (see Fig.4)		>	50	dB
Input current saturation control at $V_{6–27}$ = 3 V	I_6	<	15	µA
Tracking between luminance and chrominance				
with contrast control over a range of 10 dB		<	2	dB
Cross-coupling between luminance				
and chrominance amplifier; note 10		<	–46	dB
Signal-to-noise ratio				
at nominal input signal; note 11	S/N	>	56	dB
Phase shift between burst and chrominance				
at nominal contrast/saturation	Δ φ	<	± 5°	
Output impedance of chrominance amplifier	$\lvert Z_{28\text{-}27} \rvert$	typ.	25	Ω
Maximum output current	I_{28}	<	15	mA
Reference part				
Phase locked loop:				
– catching range; note 4		>	500	Hz
		typ.	700	Hz
– phase shift; note 5		<	5°	
Oscillator:				
– temperature coefficient of oscillator frequency; note 4		typ.	–1,5	Hz/K
– frequency deviation for V_P changing from 10 to 13,2 V; note 4		typ.	40	Hz
– input resistance (pin 26)	$R_{26\text{-}27}$	typ.	340	Ω
		260 to 420		Ω
– input capacitance (pin 26)	$C_{26\text{-}27}$	<	10	pF
– output resistance (pin 25)	$R_{25\text{-}27}$	typ.	150	Ω
			100 to 200	Ω
– output voltage (peak-to-peak value; pin 25)	$V_{25–27(p\text{-}p)}$	typ.	700	mV
A.C.C. generation:				
– reference voltage (pin 4)	$V_{4–27}$	typ.	4,9	V
– control voltage at nominal input signal (pin 2)	$V_{2–27}$	typ.	5,1	V
– control voltage without chrominance input (pin 2)	$V_{2–27}$	typ.	2,65	V
– colour-off voltage (pin 2)	$V_{2–27}$	typ.	3,15	V
– colour-on voltage (pin 2)	$V_{2–27}$	typ.	3,4	V
– identification-on voltage (pin 2)	$V_{2–27}$	typ.	1,9	V

– change in burst amplitude with supply voltage (± 10%)		proportional		
– change in burst amplitude with temperature		typ.	0,1	%/K
		<	0,25	%/K
– voltage at pin 5 at nominal input signal	V_{5-27}	typ.	5	V
Demodulator part				
Input burst signal amplitude (peak-to-peak value) between pins 21 and 22; note 6	$V_{21-22(p-p)}$	typ.	100	mV
Input impedance between pins 21 and 22	$\lvert Z_{21-22} \rvert$	typ.	2	kΩ
Ratio of demodulated signals for equal input signals at pins 21 and 22				
(B-Y)/(R-Y)	$\frac{V_{16-27}}{V_{12-27}}$	typ.	1,78 ± 10%	
(G-Y)/(R-Y); no (B-Y) signal	$\frac{V_{14-27}}{V_{12-27}}$	typ.	–0,51 ± 10%	
(G-Y)/(B-Y); no (R-Y) signal	$\frac{V_{14-27}}{V_{16-27}}$	typ.	–0,19 ± 25%	
Frequency response between 0 and 1 MHz			–3	dB
Cross talk between colour demodulated signals		>	40	dB
Phase difference between (R-Y) signal and (R-Y) reference signal		<	5°	
Phase difference between (R-Y) and (B-Y) reference signals		typ.	90°	
			85 to 95°	
R.G.B. matrix and amplifiers				
Output voltage (peak-to-peak value) at nominal luminance/contrast		typ.	5,4	
(black to white); note 3	$V_{12,14,16-27(p-p)}$		4,5 to 6,3	V
				V
Output voltage (peak-to-peak value) of the RED channel at nominal contrast/saturation and no luminance signal at the input, (R-Y) signal	$V_{12-27(p-p)}$	typ.	5,25	V
			3,7 to 6,7	V
Maximum peak white level; note 7		typ.	9,3	V
			9,0 to 9,6	V
Maximum output current	$I_{12,14,16}$	<	15	mA
Black level at the output for a brightness control voltage of 2 V	$V_{12,14,16-27}$	typ.	2,6	V
Difference in black level between the three channels at an output level of 3 V; note 8	ΔV	<	200	mV
Black level shift with vision contents		<	40	mV
Brightness control voltage range	see Fig.5			

Input current brightness control	I_{11}	<	50	μA
Variation of black level with temperature	ΔV	typ.	0,35	mV/K
		<	1,0	mV/K
Variation of black level with contrast control	ΔV	typ.	10	mV
		<	200	mV
Relative spread between the R, G and B output signals		<	10	%
Relative black-level variation between the three channels during variation of contrast and supply voltage		typ.	0	mV
		<	20	mV
Differential black-level drift over a temperature range of 40 °C		typ.	0	mV
		<	20	mV
Blanking level at the RGB outputs		typ.	2,1	V
		1,9 to 2,3		V
Difference in blanking level of the three channels		typ.	0	mV
Differential blanking level drift over a temperature range of 40 °C		typ.	0	mV
Tracking of output black level with supply voltage	$\frac{\Delta V_{bl}}{V_{bl}} \times \frac{V_P}{\Delta V_P}$	typ.	1,1	
Signal-to-noise ratio of output signals; note 11	S/N	>	62	dB
Residual 4,4 MHz signal at RGB outputs (peak-to-peak value)		typ.	40	mV
		<	150	mV
Residual 8,8 MHz signal and higher harmonics at the RGB outputs (peak-to-peak value)		typ.	75	mV
		<	150	mV
Output impedance of RGB outputs	$\lvert Z_{12,14,16\text{-}27} \rvert$	typ.	50	Ω
Frequency response of total luminance and RGB amplifier circuits for f = 0 to 5 MHz		<	–3	dB
Signal insertion (pins 13,15 and 17)				
Input signals (peak-to-peak value) for an RGB output voltage of 5 V peak-to-peak	$V_{13,15,17\text{-}27(p\text{-}p)}$	typ.	1	V
		0,85 to 1,1		V
Difference between the black levels of the RGB signals and the inserted signals at the output; note 9	ΔV	<	260	mV
Output rise time	t_r	typ.	40	ns
		<	80	ns
Differential delay time for the three channels	t_d	typ.	0	ns
		<	40	ns
Input current	$I_{13,15,17}$	<	10	μA

Data blanking (pin 9)				
Input voltage for no data insertion	$V_{9\text{-}27}$	<	0,4	V
Input voltage for data insertion	V_{9-27}	>	0,9	V
Maximum input voltage	V_{9-27}	<	3	V
Delay of data blanking	t_d	<	20	ns
Input current	I_9	<	35	μA
Input impedance	$\lvert Z_{9\text{-}27} \rvert$	typ.	10	kΩ
Suppression of the internal RGB signals when V_{9-27} > 0,9 V		>	46	dB
Sandcastle input (pin 8)				
Level at which the RGB blanking is activated	$V_{8\text{-}27}$	typ.	1,5	V
			1 to 2	V
Level at which burst gating and clamping pulse are separated	$V_{8\text{-}27}$	typ.	7,0	V
			6, 5 to 7,5	V
Delay between black level clamping and burst gating pulse	t_d	typ.	0,4	μs
Input current for:				
$V_{8\text{-}27}$ = 0 to 1 V	$-I_8$	<	1	mA
$V_{8\text{-}27}$ = 1 to 8,5 V	I_8	typ.	20	μA
$V_{8\text{-}27}$ = 8,5 to 12 V	I_8	<	2	mA

Notes to the characteristics

1. Signal with the negative-going sync; amplitude includes sync pulse amplitude.
2. Indicated is a signal for a colour bar with 75% saturation, so chrominance to burst ratio is 2,2 : 1.
3. Nominal contrast is specified as the maximum contrast –3 dB and nominal saturation as the maximum saturation –6 dB.
4. All frequency variations are referred to the 4,4 MHz carrier frequency.
5. For ± 400 Hz deviation of the oscillator frequency.
6. These signal amplitudes are determined by the a.c.c. circuit of the reference part.
7. When this level is exceeded, the amplitude of the output signal is reduced via a discharge of the capacitor at pin 7 (contrast control). The start of the peak white limiting action has a delay of one line period.
8. The variation of the black level depends directly on the gain of each channel during brightness control in the three channels. As a consequence, the black levels at the outputs (for output levels above or below 3 V) can have a difference which exceeds 200 mV. Because the amplitude and the black level change with brightness control have a direct relationship, no discolouring can occur, caused by adjustment of contrast and brightness.
9. This difference occurs when the source impedance of the data signal inputs is 150 Ω and the black level clamp pulse duration is 4 μs (sandcastle pulse). A lower difference is obtained when the impedance is lower.
10. Cross-coupling is measured under the following condition. Input signals nominal, contrast and saturation such that nominal output signals are obtained. The signals at the output at which no signal should be available must be compared with the nominal output signal at that output.
11. The signal-to-noise ratio is specified as peak-to-peak signal with respect to r.m.s. noise.

APPLICATION INFORMATION

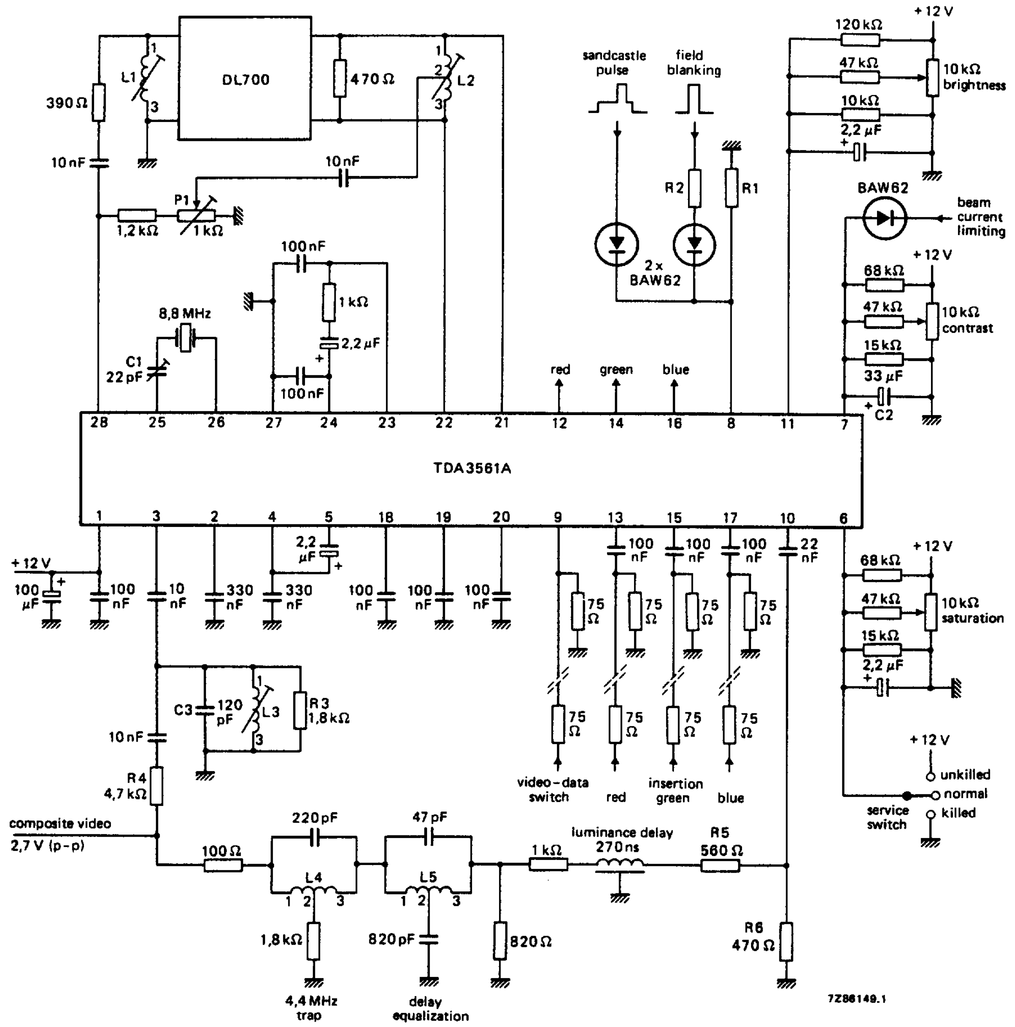

Fig.6 Application circuit.

Adjustments (see Fig.6)

C1	8,8 MHz oscillator	
L1	phase delay line	= 10,7 μH
L2	nominal value	= 10,7 μH
L3	4,4 MHz chrominance input filter	= 10,7 μH = L1
L4	4,4 MHz trap in luminance signal line	= 5,6 μH
L5	delay equalization	= 66,1 μH
P1	amplitude of direct chroma signal	
R1 R2	field blanking $\frac{R1}{R1 + R2}$ x field blanking amplitude 2,0 V to 6,5 V.	

For a video input voltage of 1 V peak-to-peak: R3 can be omitted; R4 = 1 kΩ; R5 must be short-circuited; R6 = 1 kΩ.

APPLICATION INFORMATION

The function is described against the corresponding pin number.

1. + 12 V power supply

The circuit gives good operation in a supply voltage range between 8 and 13,2 V provided that the supply voltage for the controls is equal to the supply voltage for the TDA3561A. All signal and control levels have a linear dependency on the supply voltage. The current taken by the device at 12 V is typically 85 mA. It is linearly dependent on the supply voltage.

2. Control voltage for identification

This pin requires a detection capacitor of about 330 nF for correct operation. The voltages available under various signal conditions are given in the specification.

3. Chrominance input

The chroma signal must be a.c.-coupled to the input.
Its amplitude must be between 55 mV and 1100 mV peak-to-peak (25 mV to 500 mV peak-to-peak burst signal). All figures for the chroma signals are based on a colour bar signal with 75% saturation, that is the burst-to-chroma ratio of the input signal is 1 : 2,25.

4. Reference voltage A.C.C. detector

This pin must be decoupled by a capacitor of about 330 nF. The voltage at this pin is 4,9 V.

5. Control voltage A.C.C.

The A.C.C. is obtained by synchronous detection of the burst signal followed by a peak detector. A good noise immunity is obtained in this way and an increase of the colour for weak input signals is prevented. The recommended capacitor value at this pin is 2,2 µF.

6. Saturation control

The saturation control range is in excess of 50 dB.
The control voltage range is 2 to 4 V. Saturation control is a linear function of the control voltage.

When the colour killer is active, the saturation control voltage is reduced to a low level if the resistance of the external saturation control network is sufficiently high. Then the chroma amplifier supplies no signal to the demodulator. Colour switch-on can be delayed by proper choice of the time constant for the saturation control setting circuit.

When the saturation control pin is connected to the power supply the colour killer circuit is overruled so that the colour signal is visible on the screen. In this way it is possible to adjust the oscillator frequency without using a frequency counter (see also pins 25 and 26).

7. Contrast control

The contrast control range is 20 dB for a control voltage change from + 2 to + 4 V. Contrast control is a linear function of the control voltage. The output signal is suppressed when the control voltage is 1 V or less. If one or more output signals surpasses the level of 9 V the peak white limiter circuit becomes active and reduces the output signals via the contrast control by discharging C2 via an internal current sink.

8. Sandcastle and field blanking input

The output signals are blanked if the amplitude of the input pulse is between 2 and 6,5 V. The burst gate and clamping circuits are activated if the input pulse exceeds a level of 7,5 V.
The higher part of the sandcastle pulse should start just after the sync pulse to prevent clamping of video signal on the sync pulse. The width should be about 4 µs for proper A.C.C. operation.

9. Video-data switching

The insertion circuit is activated by means of this input by an input pulse between 1 V and 2 V. In that condition, the internal RGB signals are switched off and the inserted signals are supplied to the output amplifiers. If only normal operation is wanted this pin should be connected to the negative supply. The switching times are very short (< 20 ns) to avoid coloured edges of the inserted signals on the screen.

10. Luminance signal input

The input signal should have a peak-to-peak amplitude of 0,45 V (peak white to sync) to obtain a black-white output signal to 5 V at nominal contrast. It must be a.c.-coupled to the input by a capacitor of about 22 nF. The signal is clamped at the input to an internal reference voltage.
A 1 kΩ luminance delay line can be applied because the luminance input impedance is made very high. Consequently the charging and discharging currents of the coupling capacitor are very small and do not influence the signal level at the input noticeably. Additionally the coupling capacitor value may be small.

11. Brightness control

The black level of the RGB outputs can be set by the voltage on this pin (see Fig.5). The black level can be set higher than 4 V however the available output signal amplitude is reduced (see pin 7). Brightness control also operates on the black level of the inserted signals.

12, 14, 16. RGB outputs

The output circuits for red, green and blue are identical. Output signals are 5,25 V (R, G and B) at nominal input signals and control settings. The black levels of the three outputs have the same value. The blanking level at the outputs is 2,1 V. The peak white level is limited to 9,3 V. When this level exceeded the output signal amplitude is reduced via the contrast control (see pin 7).

13, 15, 17. Inputs for external RGB signals

The external signals must be a.c.-coupled to the inputs via a coupling capacitor of about 100 nF. Source impedance should not exceed 150 Ω. The input signal required for a 5 V peak-to-peak output signal is 1 V peak-to-peak.
At the RGB outputs the black level of the inserted signal is identical to that of normal RGB signals. When these inputs are not used the coupling capacitors have to be connected to the negative supply.

18, 19, 20. Black level clamp capacitors

The black level clamp capacitors for the three channels are connected to these pins. The value of each capacitor should be about 100 nF.

21, 22. Inputs (B-Y) and (R-Y) demodulators

The input signal is automatically fixed to the required level by means of the burst phase detector and A.C.C. generator which are connected to pin 21 and pin 22. As the burst (applied differentially to those pins) is kept constant by the A.C.C., the colour difference signals automatically have the correct value.

23, 24. Burst phase detector outputs

At these pins the output of the burst phase detector is filtered and controls the reference oscillator. An adequate catching range is obtained with the time constants given in the application circuit (see Fig.6).

25, 26. Reference oscillator

The frequency of the oscillator is adjusted by the variable capacitor C1. For frequency adjustment interconnect pin 21 and pin 22. The frequency can be measured by connecting a suitable frequency counter to pin 25.

28. Output of the chroma amplifier

Both burst and chroma signals are available at the output. The burst-to-chroma ratio at the output is identical to that at the input for nominal control settings. The burst signal is not affected by the controls. The amplitude of the input signal to the demodulator is kept constant by the A.C.C. Therefore the output signal at pin 28 will depend on the signal loss in the delay line.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.
